

Dock Stabilization & Wave Attenuation

How Does It Work?

When a wave strikes and attempts to move the dock, the water in the lower shell cannot be quickly expelled. This causes the Wave Defender® to act like a stabilizer, reducing the motion of the dock and increasing its stability in wave action.

The lower, empty shells are typically equipped with our standard nine-hole pattern but can also be ordered with one hole for ventilation allowing builders to customize based on their plans .

The Wave Defender® comes in a 3ft. x 4ft. x 20in. standard size and can be used with both new and existing wood, steel or aluminum docking systems.

Pair Permafloat® with the Wave Defender® dock stabilization to reduce rocking and rolling of your dock

See the Wave Defender® in action in our Permafloat Difference video!
